

Wall Capping

Wall capping system in a variety of metals.

The system consists of capping sections, generally 2000mm - 3000mm long.

The capping width/overall sizes available depends on the available coil sizes.

The faces need to be a minimum of 70mm

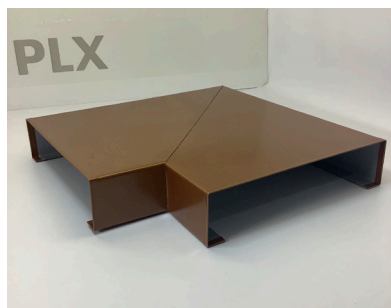

Galvanized steel liner flashings along with the capping joints are fitted.

Next a structured underlay is placed over the top for the capping to rest on.

Finally the capping sections are installed by hooking one side under its liner.

Then the other side of the capping is folded under the opposite liner securing in place.

Greencoat PLX Pural BT in Metallic Copper

Pre Formed Corners

Each preformed corner section is carefully soldered along the joint.

Joint

Joining sections with double vulcanized seals & cover flashing.

End Caps

Wall capping sections can be supplied with an end cap folded and soldered place.

Use the order form over leaf to request a budget price for basic capping elements. To finalise the price/order, a drawing must be supplied.

Capping is made to your specifications, a plan showing all the dimensions and any angles for sections & corners is important to ensure accuracy.

Capping Order Form

Materials

Front Face	Rear Face	Width
mm	mm	425mm

#Lengths@2000mm	Joints	Corners	End Caps

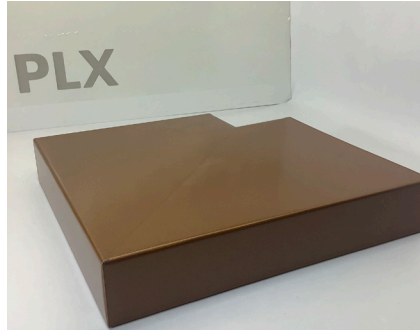

Ordering Capping

*Circle to select the required metal finish.
Total girth is limited by the coil sizes available.

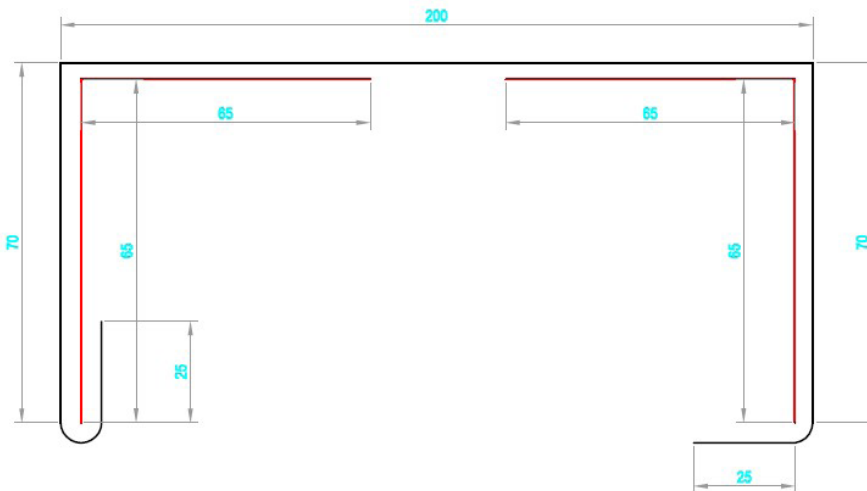

The minimum recommended face is 75mm

This form allows for requesting a budget price.
Based on number of 2 metre capping sections.
Number of joints, corners & end caps.

To price accurately we need an accurate plan
Example capping section drawing below.
Full plan example can be found at.
